

Lower NLL, but more correct choices lost than repaired

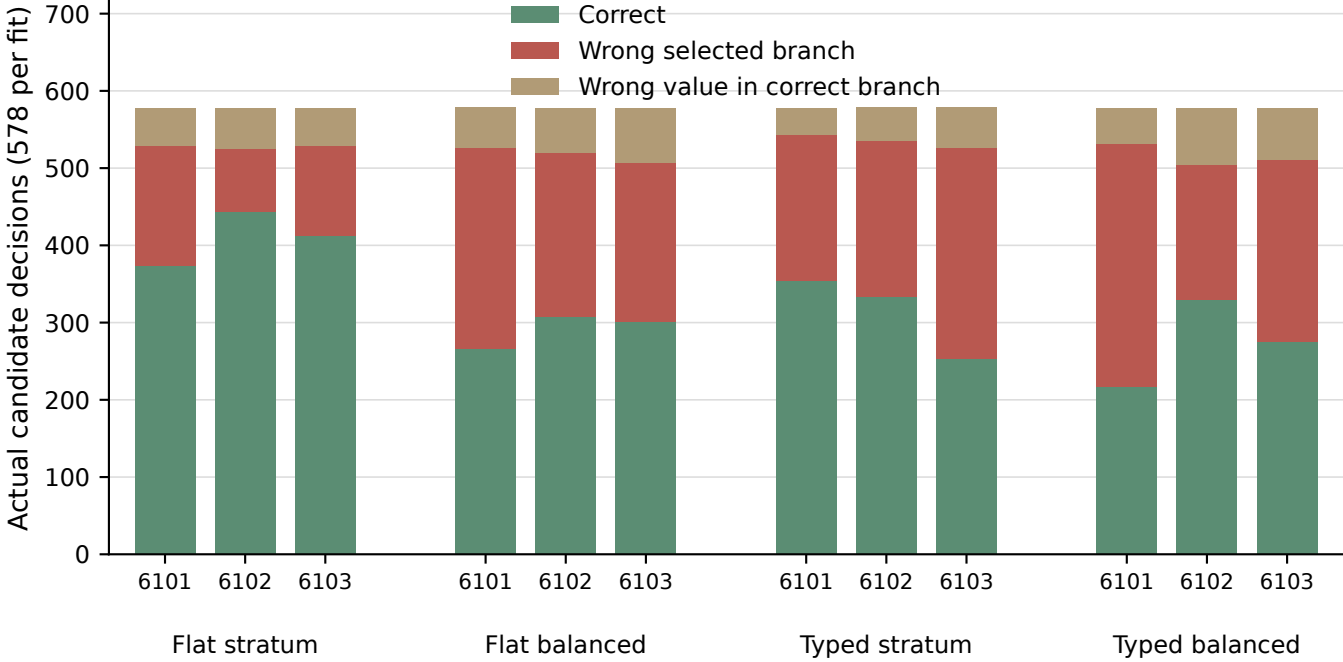

Original continuation: FAIL (5 of 9 checks passed). Posthoc decomposition; no rule or decision changed.
Typed balanced minus flat balanced: mean branch NLL -0.553, value NLL -0.129 nats.

Across three paired seeds: 176 correct-to-wrong choices versus 122 wrong-to-correct choices.

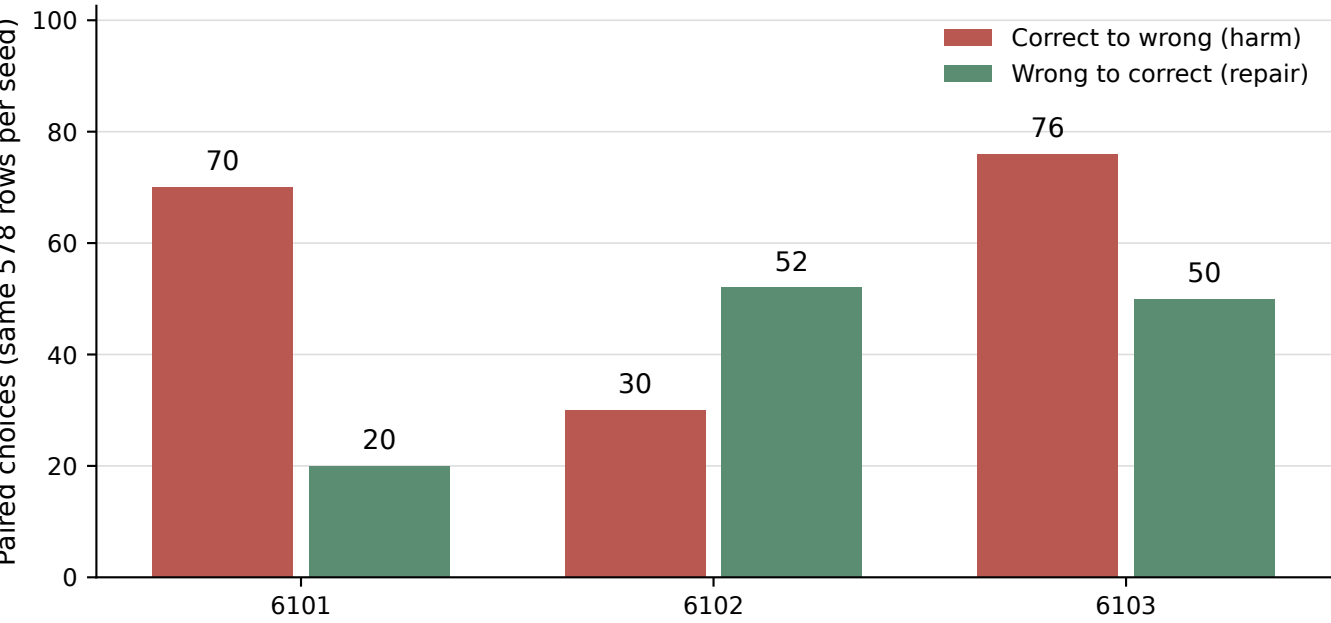

A All 12 fits: exact loss decomposition

B The candidate argmax determines the error

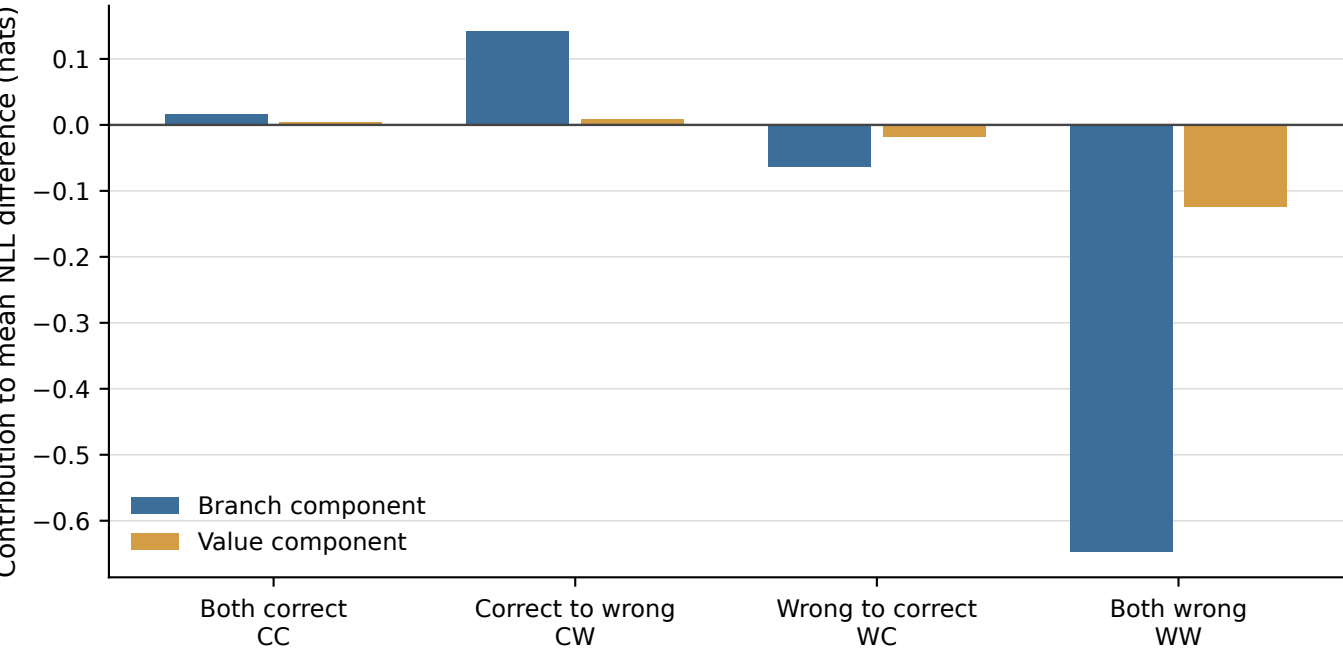

C Typed balanced versus flat balanced

Sum across repeated fits: 176 harms, 122 repairs.
These are counts, not rates with different denominators.

Primary: 578 changed rows, 6 held-out services in historically exposed TRAIN; correct previous value supplied.
All methods use the same rows. Repeated seeds are not independent data; counts and equal-service losses use different weights.
Wrong branch means the branch of the selected candidate, not the largest summed branch mass.
Saved-summary visualization only. Contribution bars are descriptive, not independently audited by this plotting script.

D Loss can fall on rows that stay wrong

Descriptive mean of three seeds; full primary equal-service weights.
Bars sum to the total loss difference, not subgroup mean differences.
