

Token alignment: synthetic capacity screen

NOT ADMITTED - stop before training

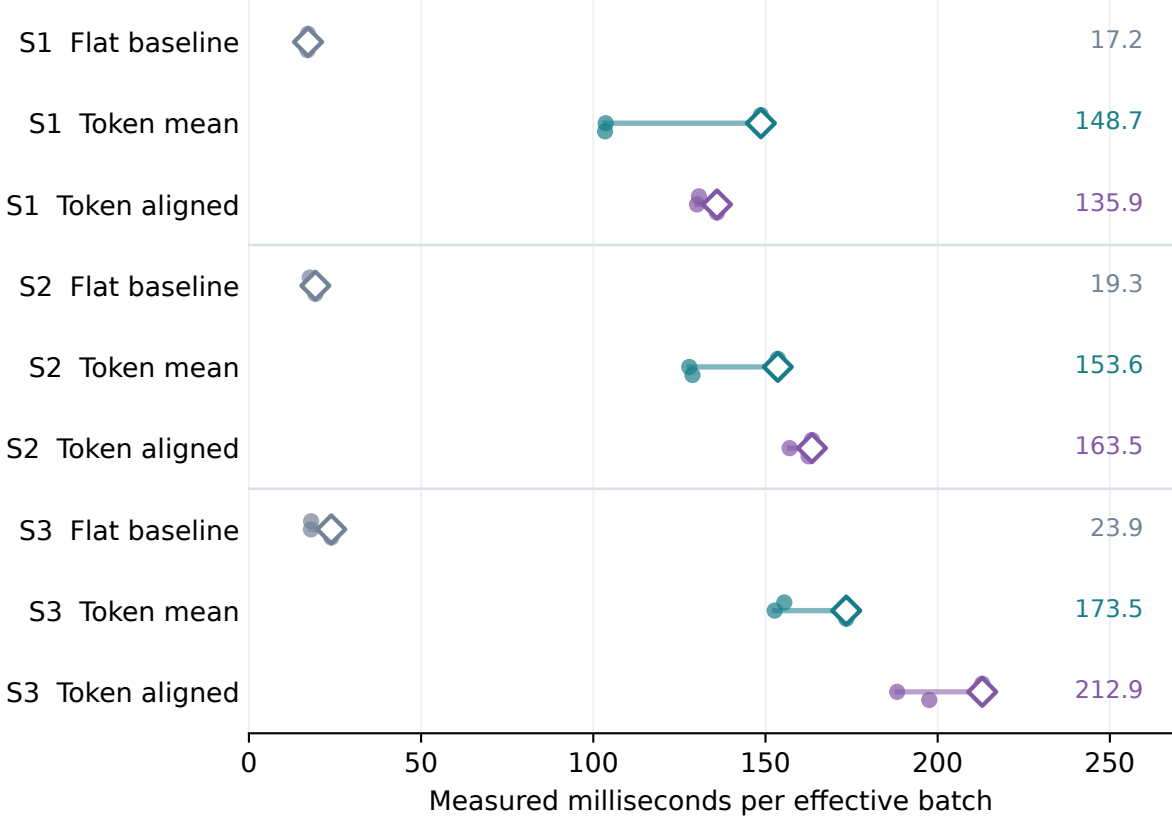

All 18 timing cells shown. Synthetic values and labels on fixed public geometry; no task-quality results.

- Each of 3 measured events
- Maximum used for projection

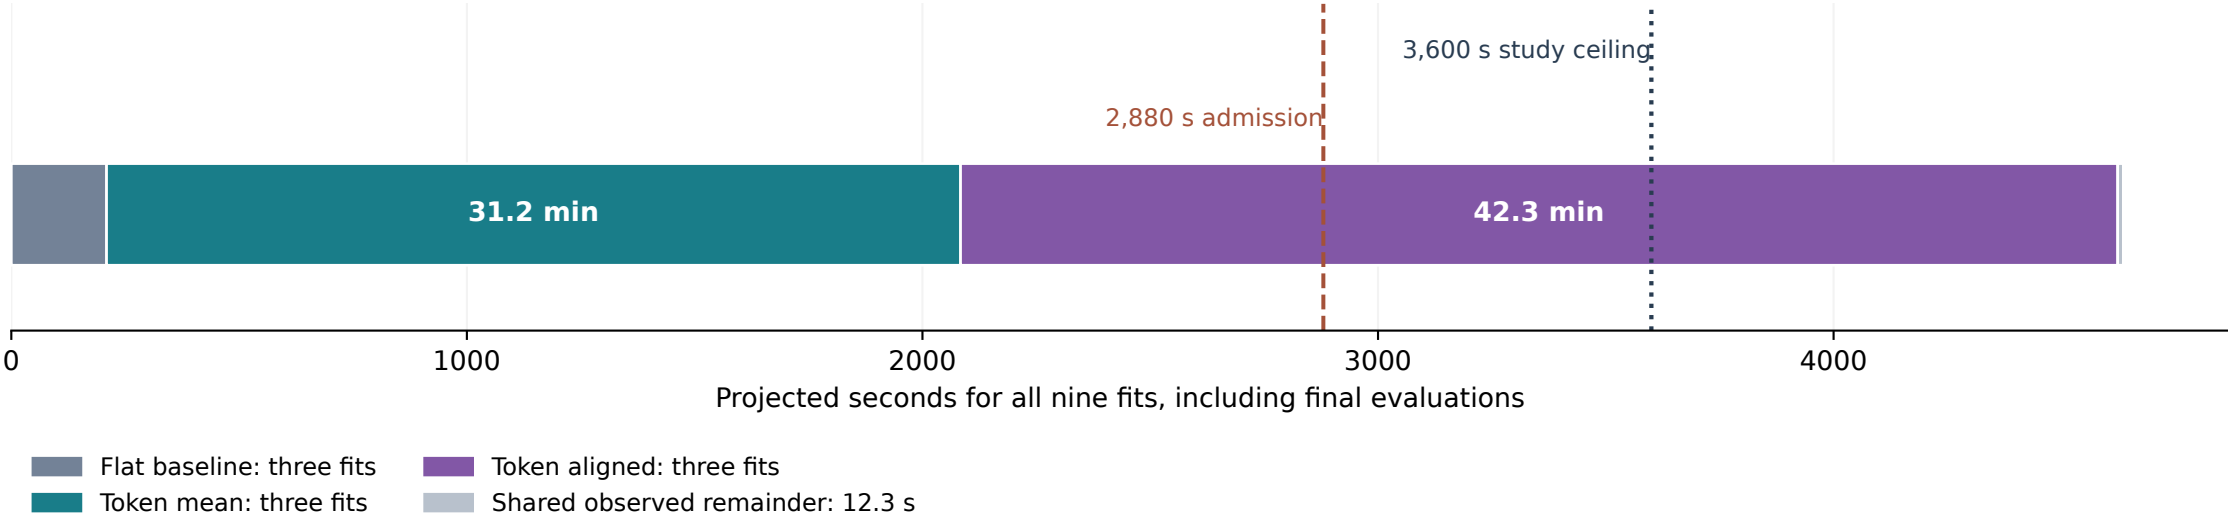

Training: forward, backward + update

Evaluation: forward + output materialization

Nine-fit projection: 4,636.0 seconds (77.27 minutes)

Projection = each stratum population × its observed maximum + shared remainder. Heuristic, not a measured full-study duration.
S1-S3 are deterministic workload strata. Warmups are in the remainder. Schema preparation (4.99 s) is recorded separately.
