

FSM residual study: DEVELOPMENT_PASS (9/9 checks)

All 12 residual recipes and the frozen VARX baseline. Shaded rows mark each architecture's saved DEV-selected rate.

100 observations / 128-step forecast. Twelve development records include correlated periods; all models use float64.
Seed markers are not confidence intervals. Latency: one warm-up, then 24 timed requests per seed; diamonds average seed medians. Missing or failed slots stay labeled.
DEV selects one rate per architecture. All rates remain visible. No new confirmation, official benchmark or novel-architecture claim.
