

Structured transition: DO NOT ADVANCE (23/61 conditions)

● Individual seed fit / deterministic reference ◇ Accuracy mean / latency median

Development on the same two previously exposed recordings. Both rates are retained in the complete table.
 Selected-rate dots show all three individual fits; accuracy diamonds are arithmetic means, not an ensemble.
 32 observed steps followed by 128 forecast steps (12.8 s), conditional on realized measured torque.
 Each forecast uses only preceding torque inputs. Internal CONFIRM and official TEST remain closed.
 Legacy fits and ridge banks are frozen parent artifacts; all latency probes are current-host.
 Different model sizes and precision; no novelty, control-safety, Rust or official benchmark claim.
 Latency includes normalization, casting, conditioning, gate/operator preparation, forecast and denormalization; excludes model loading.
