

Olfactory search: recent observations explain most of the benefit

512 sampled-source searches | 64 paired cases | 8 controllers | Continuation FAIL: 7/10

Dots: eight fixed blocks; bars: means. Initial-hit strata weighted by the upstream mixture. No confidence intervals shown. All controllers retain the initial hit and visited-cell ledger. Controller cost includes actor initialization, filtering and planning. Classical references only; no trained model or biological-wiring result. This is not the official survival-weighted evaluator.
