

Robot residual coupling: 20/55 screen conditions passed

● Individual fit / deterministic reference ◇ Family arithmetic mean

Conditional offline prediction given future realized measured torque; 32 observed steps, 128 forecast steps (12.8 s).
New causal per-recording preprocessing. Internal DEV after two-rate selection; not an official benchmark score.
Dots show every selected fit; diamonds show arithmetic family means, not an ensemble. No CONFIRM or official TEST access.
Direct-history ridge reads all future torques jointly; autoregressive models consume them stepwise.
That ridge is a high-resource conditional reference, not a causally matched world model.
Latency includes normalization, conditioning, forecasting and denormalization; excludes model loading.
