

Bounded robot transition: 27/45 development conditions passed

Development on the same two previously exposed recordings. Both rates are retained in the complete table.
Selected-rate dots show all three individual fits; accuracy diamonds are arithmetic means, not an ensemble.
32 observed steps followed by 128 forecast steps (12.8 s), conditional on realized measured torque.
Each forecast uses only preceding torque inputs. Internal CONFIRM and official TEST remain closed.
Different model sizes and precision; no novelty, control-safety or official benchmark claim.
Latency includes normalization, casting, conditioning, spectral norms, forecast and denormalization; excludes model loading.
