

# RockSample: does older public information improve control?

192 episodes | 8 maps x 4 resets x 6 controllers | Continuation FAIL: 3/10 conditions

Each dot is one map's four-reset mean; bars mark equal-map means. No confidence intervals shown.

\*Privileged reference sees the true map and qualities. Controller time includes filtering and planning; excludes simulator and trace I/O.

Classical filters and a fixed planner only. This experiment trains no architecture and measures no biological-wiring advantage.
