

OpenJev: continuation supervision for a recurrent chess actor

Predeclared continuation gate: DID NOT PASS

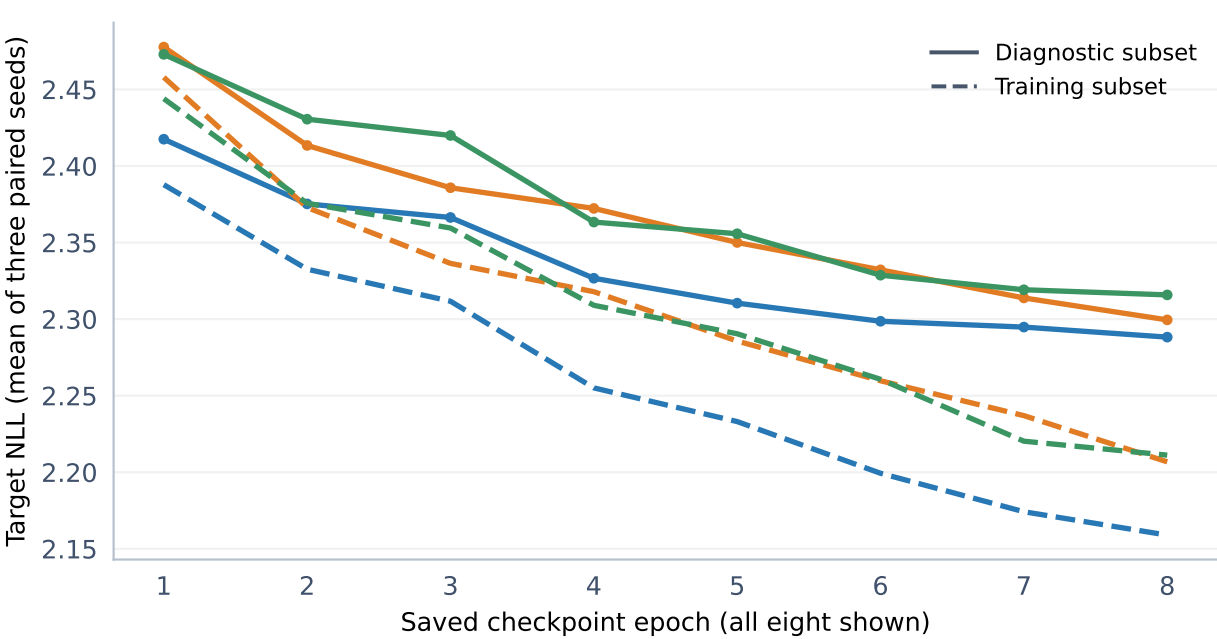

All 9 fits, all 8 checkpoints, all 192 scheduled games. Epoch 8 is primary; no best-seed selection.

Policy Best-value Continuation Seed 193 Seed 211 Seed 227 Engine mean

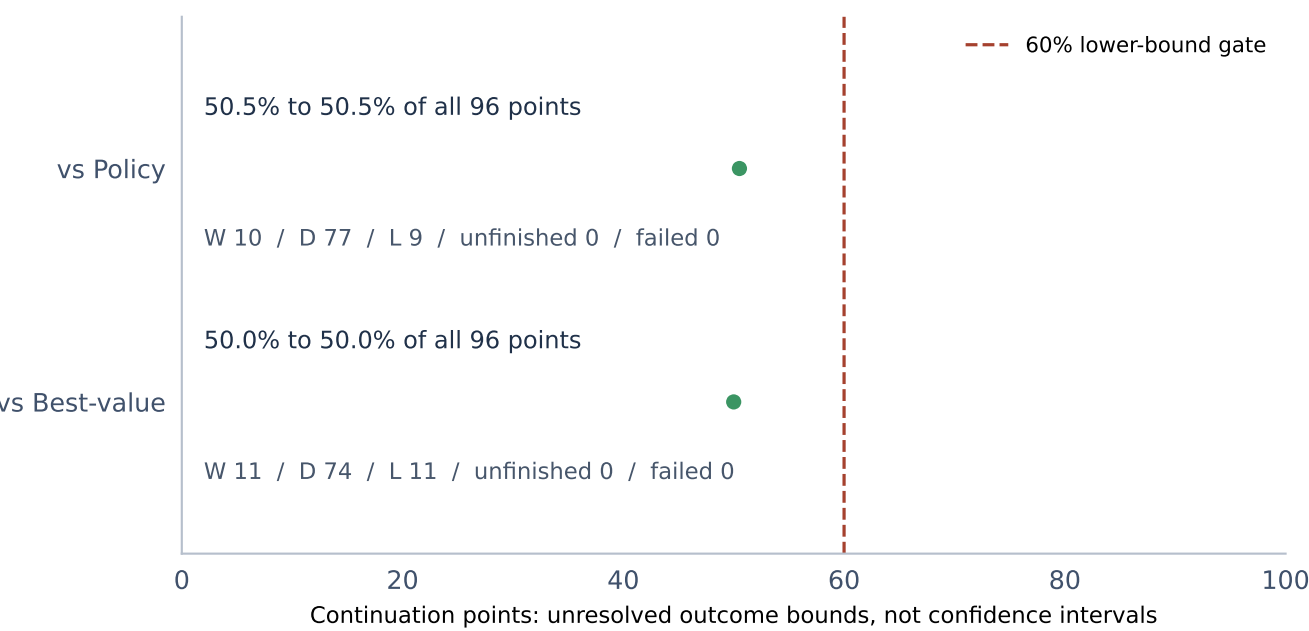

A. Final checkpoints: 128 positions per panel

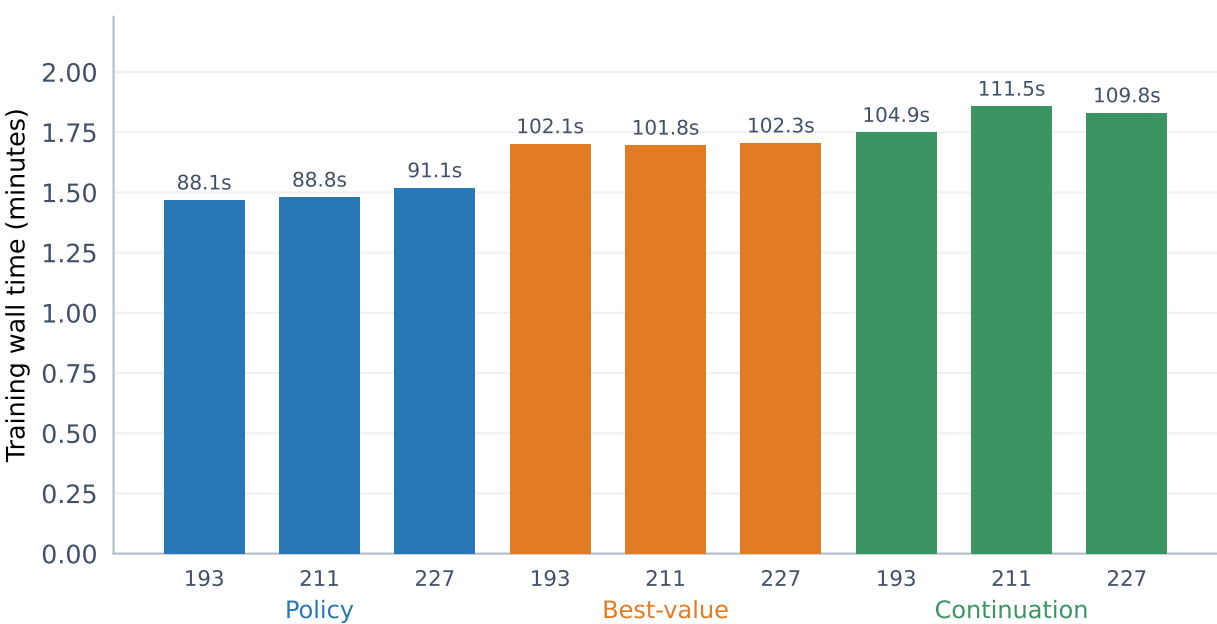

B. Fixed subsets: 2,048 roots per partition

C. Paired games: all 192, actor-only inference

D. Every completed fit: recorded MPS wall time

Engine loss = $\text{mean}[\tanh(\text{unrestricted cp}/600) - \tanh(\text{chosen cp}/600)]$; 20,000 Stockfish nodes per call. Signed losses are retained.

Timing includes fit updates, journal writes and checkpoint saves; excludes model/optimizer setup and all evaluation. Shared host, not isolated throughput.

Means use every paired seed. Arena bounds keep unfinished and failed games in the denominator; no imputed draws or discarded games.

Exposed historical development evidence. No Elo, broad playing-strength, architectural novelty or world-model claim.
