

Can compact additive memory preserve older odor evidence?

Fixed DCT compression | 96 saved trajectories | 2,164 decisions | All 12 arms shown

After 32: 538 decisions in 23 cases. No new gameplay, training or architecture advantage.

Quality bars use mixture-weighted prefixes. Diamonds use mixture-weighted case means; that all-case summary favors recent-32 over DCT 16.

DCT zero/near are both predeclared finite fills for excluded cells. Every spectral arm also stores a persistent 2,809-byte hard-support mask.

Memory excludes Python metadata. Spectral shared model: 423.6 KiB; additional planner kernel: 357.8 KiB. Dense decoding/planning workspace remains.

Exact log and both DCT 53 arms are numerical controls. Timing includes initialization, updates, decoding and planning, not whole-study overhead.

Recorded full-policy paths only; proposed actions were never executed. No efficacy threshold or reversal of the original continuation failure.
